PROBLEM GATE 2007 (MA), Q. 14:

Let X and Y be jointly distributed random variables having the joint probability density function

$$f(x, y) = \begin{cases} \frac{1}{\pi}, & \text{if } x^2 + y^2 \leq 1 \\ 0, & \text{otherwise} \end{cases}$$

Then $P(Y > \max(X, -X))$ is

SOLUTION:

The pdf of X and Y are:

$$f_X(x) = \int_{-\infty}^{\infty} f(x, y) dy \quad (0.0.1)$$

$$= \int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \frac{1}{\pi} dy \quad (0.0.2)$$

$$= \frac{2\sqrt{1-x^2}}{\pi} \quad (0.0.3)$$

$$f_Y(y) = \int_{-\infty}^{\infty} f(x, y) dx \quad (0.0.4)$$

$$= \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} \frac{1}{\pi} dx \quad (0.0.5)$$

$$= \frac{2\sqrt{1-y^2}}{\pi} \quad (0.0.6)$$

The value of $\Pr(-X < Y < X)$ is:

$$\begin{aligned} \Pr(-X < Y < X) &= \int_{-X}^X f_Y(y) dy \\ &= \int_{-X}^X \frac{2\sqrt{1-y^2}}{\pi} dy \quad (0.0.7) \\ &= \frac{2}{\pi} (\sin^{-1} X + X \sqrt{1-X^2}) \quad (0.0.8) \end{aligned}$$

Integrating our probability over all of X we get the value of $\Pr(Y > \max(X, -X))$:

$$= \int_{-\infty}^{\infty} f_X(x) \Pr(-X < Y < X) dx \quad (0.0.9)$$

$$= \left(\frac{2}{\pi}\right)^2 \int_0^1 \sqrt{1-x^2} (\sin^{-1} X + X \sqrt{1-X^2}) dx \quad (0.0.10)$$

$$= \frac{4 \cdot \pi^2}{\pi^2 \cdot 16} \quad (0.0.11)$$

$$= \frac{1}{4} \quad (0.0.12)$$

The probability for:

$$\Pr(Y > \max(X, -X)) = \frac{1}{4} \quad (0.0.13)$$
